NOTES:

For assemblies with a coupling, you should choose one as balanced as possible in order to reduce the vibrations and dynamic stresses to which the motor shaft may be subject.

Always make sure that the torque is less than or equal to the admissible torque of the shaft. Do not apply a direct axial or radial load on the motor shaft; if necessary, use suitable supports. Always use well-filtered oils containing no water or other emulsifying substance.

Never run the motor with oil and air solutions.

For motor with outlets on the flange, it is recommended not to exceed a flow rate of

4 l/min	XV-0M
20 l/min.	XV-1M
35 l/min	XV-2M

Table of pressure drops

Note: based on the oil viscosity and capacity of a pump it is possible to determine the pressure drop for every 100 m of piping by means of the table.

On the viscosity, flow rate and internal pipe diameter scales, fix the corresponding values **V**, **Q** and **D**.

Join points **V** and **Q** with a straight line intersecting point **I** on the "index" line.

From this point **I**, pass a straight line through **D** until meeting the pressure drop scale at point **P**; the corresponding value represents the pressure drop at point **P**; the corresponding value represents the pressure drop along 100 m of piping.

EXAMPLE: a pipe through which a fluid having a viscosity of 150 cSt. flows at a rate of 200 l/min and which has a diameter of 40 mm will have a pressure drop of 1 kg/cm² for every 100 m of length.

V= Viscosity cSt -°E

I= Index line of intersection

D= Internal pipe diameter in mm

Q= Flow rate in l/min

P= Pressure drop kg/cm² per 100 m
